Akarsh N

akarshn.codes@gmail.com · Dindigul, Tamil Nadu, India
akarshncodes.github.io · github.com/akarshncodes · linkedin.com/in/akarshncodes

Second-year Computer Science student and team lead who has taken four projects from problem statement to a working, tested product, winning prizes at two national-level hackathons. I write the spec, split the work, build in phases with AI tools and test every result. Seeking an AI, full-stack or product internship.

Projects

CHAKRAVYUH — *AI that uncovers money-laundering networks* **2nd place · IGNITRRON'26**

- Built identity matching, a cross-bank money graph and fraud-pattern detectors; AI agents draft each case
- Caught **11 of 12** hidden laundering rings with **0 false alarms** on an 80,000-transaction test set
- Led Team Tech Coders to a live demo in 24 hours; code checked all **246** facts the AI wrote

Case study: akarshncodes.github.io/chakravyuh · github.com/akarshncodes/chakravyuh · Live demo

NEER — *six AI agents that investigate water leaks and verify every repair* **4th place · HackSprint'26**

- Designed a LangGraph agent loop with 19 tools on 4 MCP servers and a hydraulic digital twin
- Passed **79 of 80** test runs (16 scenarios × 5 new seeds); **0** cases closed while still leaking
- Led Team Vector Zero; in code, a supervisor approves every dig and a separate check proves each fix

Case study: akarshncodes.github.io/neer · github.com/akarshncodes/NEER

GoldenLine — *real-time hospital bed and blood coordination for emergencies* **Smart India Hackathon 2026**

- FastAPI backend with atomic bed locks, so two ambulances can never claim the same last bed
- As team captain, wrote a **23**-part requirements plan and shipped it with **283** automated tests

Case study: akarshncodes.github.io/goldenline · github.com/akarshncodes/goldenline

cadastra — *maps property boundaries from drone images and marks its guesses* **Smart India Hackathon 2026**

- Measured that **45–84%** of legal property lines can't be seen from above, across four towns
- Led the team building a pipeline that fills the gaps and labels each line observed or inferred

Case study: akarshncodes.github.io/cadastra

Also built: SafeZone (ESP32) · Strategy Lab (trading simulator) · Habits (Mac app) · Java hospital system

Achievements

2nd place, IGNITRRON'26 national-level hackathon, KPR Institute, Coimbatore · ₹10,000 — Sep 2026

4th place, HackSprint'26 national-level hackathon, Velammal College, Madurai · ₹3,000 + shield — Oct 2026

Smart India Hackathon 2026: team captain; cleared both internal rounds; two entries submitted — Sep 2026

Skills

Languages	Python, Java, C++ (coursework)
Backend and data	FastAPI, SQLAlchemy, Alembic, SQLite, NetworkX, GeoPandas, Streamlit
AI systems	LangGraph, Model Context Protocol (MCP), LLM function calling, checking AI output
Leadership	Led 4 hackathon teams: scoping, specs, splitting the work, deadlines and live demos
How I build	Spec first, then phased builds with Claude Code, tests and Git at every step

Education

B.E. Computer Science and Engineering, PSNA College of Engineering and Technology — Expected May 2029
Dindigul, Tamil Nadu · CGPA **8.47 / 10**
